

---

The Geometry Dash 2.11 in-game mod menu MacOSX is a utility for the game Geometry Dash, allowing players to install mods without having to download them manually. Geometry Dash is an amateur platformer videogame that became prominent through word of mouth. The 2D-runner was released by RobTop Games on July 18th, 2014 and has gathered over 1 billion downloads on mobile devices around the world since then. One aspect of the game that people liked was its customizability - it allowed players to change songs, colors or even graphics while playing, but this could only be done by downloading third party software or undergoing difficult steps in-game. These steps weren't very pleasant and easy to do, and the best way to install mods was by downloading them manually. One year after the release of Geometry Dash, the mod menu MacOSX was released on July 18th, 2015. It is a tool that allows players without any programming knowledge to easily install mods for Geometry Dash. The mod menu MacOSX is a fork of the wildly popular Geometry Dash Meltdown Mod menu. It is currently in its initial version with support for MacOSX, Windows 10 and Linux. A second major release of this tool will be in Q1 2017 after RobTop Games releases their new maps in 3 episodes over 2017. A new version of this tool will probably be released after that, and will probably allow downloading of maps for the Geometry Dash story mode. This mod menu MacOSX was designed in such a way that it can be expanded when needed and is written in the Python programming language where it is also cross-platform compatible. This tool was started by a group of friends with no prior experience programming in the Python language. The aim of this project was to make an easy to use software instead of requiring users to understand how to program, make mods or do anything else. The tool at this current stage is a fork of the wildly popular Geometry Dash Meltdown mod menu.

The Software was built for speed and is very fast, at least in comparison to other mods which can take a lot of time to load. The Geometry Dash In-Game Modlist MacOSX can be used on any version from 0.9.4 to 2.11 with no problems on either Windows or Mac OSX. In total there are seven mods which currently work in the In-Game Mod Options menu MacOSX:

The newest mods listed in the menu are "Geometry Dash Part 1" and "Geometry Dash Part 2". After the release of the MacOSX, a lot of people were interested in either getting one for themselves or asking how to do it. This is a step by step guide on how to make and use the In-Game Mod Settings menu on MacOSX from scratch.

In order to have access to the Geometry Dash In-Game Mod Options menu, you will need to do these things: Next, you will need Python 2.7 installed on your Operating System.
